

Multiple Messaging Services

September 2006

Multiple Messaging Services

OVERVIEW

MMS is design to extend the RosettaNet architecture to support flexible, low-cost document exchange models and also to support emerging and existing messaging specifications, enhanced messaging capabilities are required beyond current RNIF specifications.

VALUE PROPOSITION

- Lower the costs of adoption of RosettaNet PIPs by leveraging other message handling [transport protocols] standards already in use or expected to be widely deployed
- Other message handling systems appear to have some significant advantages for the exchange of PIPs versus RNIF
- Broader, appeal for using RosettaNet PIPs in other vertical industries besides high tech and telecommunications
- Alignment with leading standards for messaging and transport saves cost by reducing the number of messaging handling systems

Multiple Messaging Services

Deliverables

EXPECTED OUTPUT

Specify precisely how to configure an implementation of a commercially available, non-RNIF messaging handling system for transporting RosettaNet PIP business messages between trading partners in reference to an Abstract Messaging Definition. (Jan 2006*)

ACCOMPLISHMENTS

- ✓ All 3 specifications are complete – AS/2, ebMS and WS-I
- ✓ Membership feedback periods are complete for all 3 specifications
- ✓ Membership vote is complete for all 3 specifications
- ✓ Validation team if formed meeting all requirement of RSM Governance
- ✓ Engineering in process of creating WSDL to test time and complexity for membership to create
